TITLE: Copolymers based on butadiene, isoprene and dimethylvinylethynyl carbinol

PERIODICAL: Kauchuk i rezina, no. 5, 1962, 1 - 4

TEXT: The article deals with the reaction of copolymerization in an emulsion of butadiene and isoprene with dimethylvinylethynyl carbinol (DMVEC), in the presence of various initiators. A comparative evaluation of the vulcanizates of these rubber bases is made. Monomers used in the reaction were: rectified butadiene, DMVEC (boiling point 58 - 59°C/13 mm, n_D^{21} 1.4786, d_4^{25} 0.8925), isoprene (boiling point 34°C, n_D^{21} 1.4203). The various initiators used were: potassium persulfate, diazoaminobenzene and glucose, diazoaminobenzene with hydroquinone. The physico-chemical properties are studied of the butadiene and DMVEC copolymers [ДК-30 (DK-30) and ДК-10 (DK-10)], and of the isoprene and DMVEC copolymers [ИК-30 (IK-30) and ИК-10 (IK-10)]. It was found in experiments that car-

bon black vulcanizates of the butadiene and IMVEC copolymers have a high tensile strength, a sufficiently high thermal resistance, satisfactory wear and crack growth resistance in repeated bends. They are superior to vulcanizates of industrial butadiene-styrene and butadiene-nitrile rubbers [CKC-30 (SKS-30) and CKH-26 (SKN-26)]. The DK-30 copolymers, produced in the presence of diazoaminobenzene and glucose, have the highest mechanical strength. The thermomechanical indices of the former are higher than those of the SKN-26 copolymers. The physico-mechanical properties of the IK-30 copolymer vulcanizates (excluding crack growth) are on one level with rubbers based on industrial SKS-30 rubber, and are superior to the latter in their crack growth resistance. The IK-10 copolymer vulcanizates are inferior to rubbers based on the industrial SKS-30 rubber as to physico-mechanical properties, excepting frost resistance.

TITLE: Copolymers based on butadiene and glycols of the isopropenylacetylene
row

PERIODICAL: Kauchuk i rezina, no. 8, 1962, 1 - 3

TEXT: The properties of copolymers containing a large number of hydroxyl groups were studied by investigating a copolymerization reaction between butadiene and glycols of the isopropenylacetylene row. The glycols used and produced by dehydration of the corresponding glycerines or by condensation of oxyketones with isopropenylacetylene, in the presence of potassium hydroxide, were: 2,3,6-trimethylheptene-6-in-4-diol-2,3 [glycol Г (G)], and 2-methyl-5(1-oxycyclopentyl)-hexene-1-in-3-ol-5 [glycol ЦГ (TsG)]. Experimental data showed the copolymer of butadiene and glycol G [ДГ-10 (DG-10)], to be non-soluble in ordinary organic solvents, and the copolymer of butadiene and glycol TsG [ДЦГ-10 (DTsG-10)], to be soluble in ether and benzene. SOURCE: Kauchuk i rezina, no. 11, 1965, 2-3

TOPIC TAGS: synthetic rubber, phenol containing rubber, copolymer 15

ABSTRACT: Phenol-containing rubbers have been prepared by emulsion copolymerization
 at 60C of butadiene and dimethyl(vinylethynyl)(4-hydroxyphenyl)methane(I) in the
 presence of diazoaminobenzene and hydroquinone. The best chemical, physical and
 mechanical properties were exhibited by copolymers containing 10% of I (SKDF-10 rubber).
 IR absorption spectra indicated that copolymerization occurs via the double band of
 I. SKDF-10 rubbers can be vulcanized by such agents as sulfur, phenol-formaldehyde
 resins, or hexamethylene tetramine. The formulation of the mixtures, the properties
 of the rubbers, vulcanization methods, and the vulcanizate properties are described
 in the source. The properties of SKDF-10 vulcanizates are similar to those of buta-
 diene-styrene SKS-30 vulcanizates, but their fatigue strength in compression is 15

TITLE: Point Source of Light in the Semiinfinite Medium

PERIODICAL: Vestnik Leningradskogo universiteta, Seriya matematiki,
mekhaniki i astronomii, 1960, No. 13, pp. 147 - 151

TEXT: According to the method of Eddington the author determines the mean intensity of the radiation caused by a lumped source of light in a semi-infinite medium. The results of a numerical calculation are given for the case where a pure scattering takes place and the source is at the boundary of the medium. It is pointed out that the intensity in the case of the semi-infinite medium is essentially smaller than in the case of the infinite medium.

TITLE: The multiple scattering of light in a spectral line

SOURCE: Leningrad. Universitet. Vestnik. Seriya matematiki, mekhaniki i astronomii, no. 1, 1964, 142-149

TOPIC TAGS: spectroscopy, spectral line, spectral line scattering, light scattering, frequency redistribution, resolvent, Lorentz profile, Doppler profile

ABSTRACT: The multiple scattering of light in a spectral line is of interest to astronomers. It is usually assumed that such scattering takes place with a complete redistribution by frequency. This signifies that the probability of radiation in line of a quantum of a definite frequency does not depend on the frequency of the quantum when it was absorbed. In such a case the transfer process can be described by a linear, integral equation whose kernel depends on the absolute value of the difference of the arguments. For example, if the radiation is propagated in an infinite plane-parallel medium, this equation has the form:

$$B(\nu) = g(\nu) + \frac{1}{4} \int K(|\nu - \nu'|) B(\nu') d\nu'. \quad (1)$$

Card 1/3

ACCESSION NR: AP4018869

where τ is the optical intensity at the center of the line, $B(\tau)$ is the source function, λ is the probability the quantum will survive a single scattering, $4\pi g(\tau)$ is the radiation source power, and it is assumed that the frequency distribution of the radiation of the quanta is proportional to the coefficient of absorption in the line. The kernel $K(\tau)$ has different forms in different situations. For $K(\tau)$ of the form:

$$K(\tau) = \int_0^{\tau} A(y) e^{-y} dy, \quad (2)$$

and for $g(\tau) = (\lambda/2)K(\tau)$, (1) takes the form:

$$B(\tau) = g(\tau) + \int_0^{\tau} \Gamma(\tau, \tau') g(\tau') d\tau', \quad (3)$$

where

$$\Gamma(\tau, \tau') = \Phi(|\tau - \tau'|) + \int_0^{|\tau - \tau'|} \Phi(t) \Phi(t + |\tau - \tau'|) dt. \quad (4)$$

Card 2/3

ACCESSION NR: AP4018869

and the functions $V_{00}(z)$ and $V(z)$ are called resolvents. In a previous paper the author found explicit expressions for the resolvents when $K(z)$ was of form (2). In the present article, these general formulas are applied to the solution of the problem of the scattering of light in a spectral line taking the redistribution by frequency into account. It is assumed that in a continuous spectrum there is no absorption. Both one- and three-dimensional media are considered. In both types of media the two cases when the absorption coefficient has a Lorentz and a Doppler profile are studied and asymptotic expressions for the resolvents are obtained. "In conclusion, the author thanks V. V. Ivanov for his guidance and help." Orig. art. has: 52 equations.

SOURCE: Astronomicheskij zhurnal, v. 41, no. 4, 1964, 669-675

TOPIC TAGS: light scattering, stellar atmosphere, nebula, planetary atmosphere, astronomy, multiple light scattering, coherent light scattering, incoherent light scattering

ABSTRACT: The study of stellar atmospheres, nebulae and planetary atmospheres involves the problem of multiple scattering of light in a medium consisting of plane-parallel layers. In the case of isotropic scattering this problem can be reduced to the solution of a linear integral equation (with finite and semi-infinite integration intervals) with a kernel dependent on the difference modulus of the arguments. If the medium is considered infinite, this equation has the form:

$$B(\tau) = g(\tau) + \frac{\lambda}{2} \int_{-\infty}^{\infty} K(|\tau - \tau'|) B(\tau') d\tau', \quad (1)$$

where τ is optical depth, read from a certain level perpendicular to the layers, $B(\tau)$ is the source function, $4\pi g(\tau)$ is the intensity of the sources at the depth τ , and λ is

TITLE: A synthetic butadiene-silicostyrene rubber

SOURCE: Kauchuk i rezina, no. 4, 1966, 2-3

TOPIC TAGS: synthetic rubber, butadiene styrene rubber, organosilicon compound, COPOLYMERIZATION, EMULSION POLYMERIZATION

ABSTRACT: In order to obtain new types of rubbers, the emulsion copolymerization of n-trimethylsilicostyrene $(CH_3)_3Si-C_6H_4-CH=CH_2$ with butadiene was studied at 60°C, with potassium persulfate or azoisobutyrodinitrile as the polymerization initiator, and also at 5°C in the presence of the redox system tert-butylisopropylbenzene - hydroquinone. n-Trimethylsilicostyrene was obtained from trimethylchlorosilane and n-chlorostyrene. The latexes obtained were stabilized with a 2% alcohol solution of Neozone D. The copolymers obtained with azoisobutyrodinitrile (DKS-30) at 60°C are poorly soluble in benzene (up to 20%); those obtained at 5°C (DKS-30Kh) dissolved in benzene almost completely, and their M_w was found to be 270,000. The DKS-30 polymers contain up to 6% Si, and DKS-30Kh, up to 5% Si; this corresponds to a copolymer composition in which 5 and 8 units of butadiene respectively are present for one unit of

n-trimethylsilicostyrene. Rubber mixtures based on SKS-30 and DKS-30Kh copolymers were prepared and vulcanized at 142°C. Vulcanizates of DKS-30 copolymer have a greater wear resistance, fatigue strength, resistance to benzene and heat resistance than vulcanizates prepared from SKS-30. ¹⁶ Vulcanizates of the low-temperature copolymers DKS-30Kh surpass vulcanizates from SKS-30A in fatigue strength and heat resistance. The remaining properties of both copolymers are the same as those of vulcanizates from SKS-30 and SKS-30A. Orig. art. has: 1 table.

TITLE: Tin-containing synthetic rubber

SOURCE: Kauchuk i rezina, no. 11, 1966, 2

TOPIC TAGS: organotin compound, synthetic rubber, *Copolymerization*

ABSTRACT: A new type of tin-containing synthetic rubber (SKDOS-30) has been produced by copolymerizing butadiene and p-trimethyltinstyrene at 60°C:

The yield of the copolymer was 60-70%. At the end of the reaction, the latex was stabilized with a 2% alcohol solution of neozone D. The latex was coagulated with a

Card 1/2

UDC: (678.762.2+678.86).547.07.004.12

ACC NR: AP6036351

solution of sodium chloride and acetic acid. The range of highly elastic deformation of the DOS-30 copolymer extends from -40 to +220 °C; the glass transition temperature is -40 °C; the copolymer begins to cross-link at 220 °C. Rubber mixtures based on SIDOS-30 copolymer were prepared in accordance with the standard recipe for SKS-30 rubber. The vulcanization of the mixtures lasted 20 min at 142 ± 1 °C. In physico-mechanical properties, SKDOS-30 vulcanizates are equivalent to rubbers based on SKS-30, with the exception of the fatigue strength, which is several times greater than that of SKS-30 rubbers.

PHASE I BOOK EXPLOITATION FGL/5981

Symposium on Electroacoustic Transducers. Krynica, 1958

Proceedings of the Symposium on Electroacoustic Transducers [held in] Krynica, 17-26 September, 1958. Warsaw, Państwowe Wydawnictwo Naukowe, 1961. 442 p. Errata slip inserted. 630 copies printed.

Sponsoring Agency: Polish Academy of Sciences. Institute of Basic Technical Problems.

Ed. in Chief: Janusz Kacprowski, Doctor of Sciences; Editing Committee: Ignacy Malecki, Professor, Doctor of Sciences; Wincenty Pajewski, Doctor; and Jerzy Wehr, Master of Sciences; Secretary: Juliusz Mierzejewski.

PURPOSE: This book is intended for physicists and acoustical engineers.

COVERAGE: The book is a collection of detailed research papers constituting the proceedings of a conference held in Krynica from 17 to 26 September 1958 under the auspices of the Institute of Technical Problems, Polish Academy of Sciences.

Card 1/8

Symposium on Electroacoustic Transducers

FCL/5981

The following basic problems are treated: 1) theoretical research on energy transformation processes; 2) experimental development of new types of transducers; 3) physical acoustical measurements; 4) technology of piezoelectric and magnetostrictive materials; 5) construction of transducers for technical needs; and 6) design of acoustical transducer systems. No personalities are mentioned. References (if any) follow the individual articles.

ACCESSION NR: AP3001766

AUTHOR: Nagiello, Zygmunt (Graduate Engineer); Chanski, Roman (Graduate Engineer)

TITLE: Underwater acoustic probe with flat efficiency characteristic in wide frequency range

SOURCE: Pomiar, automatyka, kontrola, no. 4, 1963, 172-175

TOPIC TAGS: sound detection, underwater acoustic probe, acoustic probe, seignette crystal

ABSTRACT: The authors discuss the selection of the type and technical characteristics of an underwater acoustic probe having a flat efficiency characteristic in a frequency range of 50 cycles to 100 kilocycles. The microphone for work in a liquid medium must be stable and insensitive to temperature changes. The microphone they used is of a piezoelectric type, made of Seignette salt crystal. The construction of the mechanical-acoustical arrangement is shown in Fig. 1 of Enclosure 1. Its representation in terms of electrical equivalents is given on Fig. 2 of Enclosure 2. The electric circuit of the probe is described in detail, it is very simple. The block diagram of the microphone-amplifier-cable arrangement is shown in Fig. 3 of Enclosure 3, and the general view is represented in Card 1/6

L 18887-63

ACCESSION NR: AP3001766

Fig. 4 of Enclosure 4. At frequencies of about 1 kcycles, the microphone efficiency S sub k is 20 microvolts per microbar. Over the entire frequency range of 50 cy to 100 key, the deviation from this efficiency is plus or minus 1.5 decibel. The efficiency characteristic is flat. The noise level at the input to the electron circuit is about 12 microvolts. The measurement range is 0.5 to 10,000 microbars. The temperature range is 10 to 30C. Two types of batteries may be used: of 67.5 V and of 1.5 V. The probe can be in use for about 20 hrs without battery change. The microphone diameter is 12 mm; the total length of the circuit is 400 mm. The probe can be used in many underwater and even gaseous-media applications. Orig. art. has: 7 figures and 7 equations.

TITLE: Point Source of Light in the Semiinfinite Medium

PERIODICAL: Vestnik Leningradskogo universiteta, Seriya matematiki, mekhaniki i astronomii, 1960, No. 13, pp. 147 - 151

TEXT: According to the method of Eddington the author determines the mean intensity of the radiation caused by a lumped source of light in a semi-infinite medium. The results of a numerical calculation are given for the case where a pure scattering takes place and the source is at the boundary of the medium. It is pointed out that the intensity in the case of the semi-infinite medium is essentially smaller than in the case of the infinite medium.
There is 1 table.

AUTHOR: Nagirner, D. I.

TITLE: The multiple scattering of light in a spectral line

SOURCE: Leningrad. Universitet. Vestnik. Seriya matematiki, mekhaniki i astronomii, no. 1, 1964, 142-149

TOPIC TAGS: spectroscopy, spectral line, spectral line scattering, light scattering, frequency redistribution, resolvent, Lorentz profile, Doppler profile

ABSTRACT: The multiple scattering of light in a spectral line is of interest to astronomers. It is usually assumed that such scattering takes place with a complete redistribution by frequency. This signifies that the probability of radiation in line of a quantum of a definite frequency does not depend on the frequency of the quantum when it was absorbed. In such a case the transfer process can be described by a linear, integral equation whose kernel depends on the absolute value of the difference of the arguments. For example, if the radiation is propagated in an infinite plane-parallel medium, this equation has the form:

$$B(\nu) = g(\nu) + \frac{1}{2} \int K(|\nu - \nu'|) B(\nu') d\nu'. \quad (1)$$

Card 1/3

ACCESSION NR: AP4018869

where τ is the optical intensity at the center of the line, $B(\tau)$ is the source function, λ is the probability the quantum will survive a single scattering, $4\pi g(\tau)$ is the radiation source power, and it is assumed that the frequency distribution of the radiation of the quanta is proportional to the coefficient of absorption in the line. The kernel $K(\tau)$ has different forms in different situations. For $K(\tau)$ of the form:

$$K(\tau) = \int_0^{\tau} A(y) e^{-y} dy \quad (2)$$

and for $g(\tau) = (\lambda/2)K(\tau)$, (1) takes the form:

$$B(\tau) = g(\tau) + \int_0^{\tau} \Gamma(\tau, \tau') g(\tau') d\tau' \quad (3)$$

where

$$\Gamma(\tau, \tau') = \Phi(|\tau - \tau'|) + \int_0^{\min(\tau, \tau')} \Phi(t) \Phi(t + |\tau - \tau'|) dt \quad (4)$$

Card 2/3

ACCESSION NR: AP4018869

and the functions $\Gamma_{00}(z)$ and $V(z)$ are called resolvents. In a previous paper the author found explicit expressions for the resolvents when $K(z)$ was of form (2). In the present article, these general formulas are applied to the solution of the problem of the scattering of light in a spectral line taking the redistribution by frequency into account. It is assumed that in a continuous spectrum there is no absorption. Both one- and three-dimensional media are considered. In both types of media the two cases when the absorption coefficient has a Lorentz and a Doppler profile are studied and asymptotic expressions for the resolvents are obtained. "In conclusion, the author thanks V. V. Ivanov for his guidance and help." Orig. art. has: 52 equations.

ACCESSION NR: AP4043955

S/0033/64/041/004/0669/0675

AUTHOR: Nagirner, D. I.

TITLE: Solution of integral equations of the theory of light scattering

SOURCE: Astronomicheskij zhurnal, v. 41, no. 4, 1964, 669-675

TOPIC TAGS: light scattering, stellar atmosphere, nebula, planetary atmosphere, astronomy, multiple light scattering, coherent light scattering, incoherent light scattering

ABSTRACT: The study of stellar atmospheres, nebulae and planetary atmospheres involves the problem of multiple scattering of light in a medium consisting of plane-parallel layers. In the case of isotropic scattering this problem can be reduced to the solution of a linear integral equation (with finite and semi-infinite integration intervals) with a kernel dependent on the difference modulus of the arguments. If the medium is considered infinite, this equation has the form:

$$B(\tau) = g(\tau) + \frac{\lambda}{2} \int_{-\infty}^{\infty} K(|\tau - \tau'|) B(\tau') d\tau', \quad (1)$$

where τ is optical depth, read from a certain level perpendicular to the layers, $B(\tau)$ is the source function, $4\pi g(\tau)$ is the intensity of the sources at the depth τ , and λ is

Card 1/3

ACCESSION NR: AP4043955

is the probability of survival of a quantum in the case of single scattering. For a semi-infinite medium the equation determining the source function has the form:

$$B(\tau) = g(\tau) + \frac{\lambda}{2} \int_0^{\infty} K(|\tau - \tau'|) B(\tau') d\tau', \quad (2)$$

where τ is read from the boundary of the medium. The form of the kernel $K(\tau)$ is determined by those processes which occur in the elementary scattering event. In most cases the kernel can be represented in the form of a superposing of exponents, that is

$$K(\tau) = \int_a^b A(y) e^{-y\tau} dy. \quad (3)$$

where $0 \leq a < b \leq \infty$. For example, in light diffusion without a change of frequency

$$K(\tau) = E_1(\tau) = \int_1^{\infty} e^{-y\tau} \frac{dy}{y}. \quad (4)$$

Kernels of the form (3) are encountered in the study of light scattering in a spectral line with frequency redistribution taken into account. In this study the author inverts the Laplace transforms for the resolvents of equations (1) and (2) for a kernel of the

Card 2/3

ACCESSION NR: AP4043955

arbitrary form (3). As an example the author considers the case of radiation diffusion without frequency change (1). Separate attention is given to the cases of a finite medium, an infinite medium and coherent isotropic scattering. The general formulas derived for the resolvents make it possible to solve fully a number of other problems in the theory of radiation propagation, especially problems of incoherent light scattering in a spectral line. Orig. art. has: 42 formulas.

ABSTRACT: In this paper the work of V. V. Sobolev (DAN SSSR, 155, 316, 1964), appearing as an article in the collection "Kinematika i dinamika zvezdnykh sistem i fizika mezhzvezdnoy sredy." Alma-Ata, "Nauka," 1965 is generalized. The asymptotic formulas which connect the solution of the problem of radiation diffusion in nebulae of large but finite optical thickness τ_0 with that for the problem with $\tau_0 = \infty$ are calculated. The model employed assumes pure scattering

and small absorption with no redistribution in frequency in the reemitted radiation. Two cases are considered: a spherical layer with inner radius r_1 and outer radius r_2 such that $r_2 - r_1 \ll r_1$, and a homogeneous sphere, both with point light source (stellar source) at the center. TOPIC TAGS: hamiltonian, resonance line, radiation intensity, resonance scattering

ABSTRACT: The authors investigated the radiative transfer in the Doppler broadened-resonance line. A semi-infinite atmosphere was considered with a negligibly small absorption in the discontinuous spectrum, using the method of approximation of complete redistribution in frequency. The intensity of the outgoing radiation was expressed by the corresponding H-function defined in the article. Tables to 5-s.f. of $H(z, \lambda)$ for a large set of values of the parameter λ were given, with special attention to values of λ close to unity. The asymptotic behavior of $H(z, \lambda)$ for $z \gg 1$ showed that for $z \gg 1$ the function $H(z, \lambda)$ did not depend on z and λ separately, but only on a certain combination of z and λ . The range of validity of the derived asymptotic expressions was Card 1/2.

SOURCE: Astrofizika, v. 2, no. 2, 1966, 147-148

TOPIC TAGS: source function, absorption coefficient, excited atom, radiation, resonance radiation, *LIGHT SCATTERING*

ABSTRACT: The source function S_p for an infinite homogeneous medium with a point energy source is studied as a function of the optical distance from the source (τ) and the wavelength (λ) on the assumption of complete frequency redistribution. The analysis is limited to $\tau \ll 1$ and $\tau \gg 1$. Three forms of absorption coefficient (Doppler, Voigt, and Lorentz) are considered. Special attention is paid to nearly conservative scattering ($1 - \lambda \ll 1$). Physical interpretation of the results is given. The effect of frequency redistribution on spatial distribution of excited atoms is discussed. Orig. art. has: 70 formulas, 2 figures, and 2 tables.

ABSTRACT: A method is recommended for determining the required degree of comminution of ores by plotting a nomogram based on the data of a preliminary quantitative microscopic analysis of the various size classes of the initial ore sample and the screen-analysis classes of grinding products. The plotting of the diagram is described.

TITLE: Xanthate and Frother Adsorption on the Liquid-gas Interface (Adsorbtsiya ksantogenatov i aeroflotov na razdele faz zhidkost'-gaz)

PERIODICAL: Tr. n.-i. i proyekt. in-ta "Uralmekhanobr", 1957, Nr 1, pp 19-38

ABSTRACT: The Traube stalagmometer is used to study gas-liquid interface adsorption of frothers, xanthates (X), mixtures thereof, and mixtures of these with pine oil. It is found that X and frother adsorption by the surface of an air bubble occurs in 1 or 2 sec and that all X except ethyl show frothing properties. Butyl frother stabilizes froth even in flotation concentrations. The influence of admixtures to the X, such as alcohols, dixanthogene, carbon disulfide, thiosulfate, and inorganic substances, is investigated. In the presence of pine oil the adsorption of all the components from the solution occurs independently when concentrations are low. In the absence of pine oil, X and frothers are adsorbed independent of each other

ABSTRACT: A description is presented of industrial experience and the results of investigations which identify the conditions for efficient employment of Zn and Cu sulfates, which are widely employed in the selective flotation of Cu-Zn-, Pb-Zn-, and Cu-Pb-Zn pyrite ores. The following subjects are clarified: the mechanism of ZnSO₄ action, the influence of Ca hydroxide on the technological properties of Zn hydroxide, the effect of non-ore-bearing minerals on the technological properties of Zn hydroxide, the effect of atmospheric O₂ on the technological properties of Ca hydroxide, the influence of Fe and Cu sulfates on the process of Zn hydroxide formation, the influence of Zn
